Backend Engineer & Tech Lead specializing in Java and distributed systems, with 3+ years delivering fintech solutions across enterprise clients.

SUMMARY

Backend engineer turned Tech Lead with 3+ years of remote experience building and scaling fintech systems. I have designed microservices for platforms serving 40,000+ users, led cross-functional teams through major technical migrations, and driven architectural decisions across multiple enterprise client accounts. Currently leading development teams at Stefanini while also conducting technical assessments for engineering hiring. Based in Buenos Aires, Argentina with professional-level English (C2).

EXPERIENCE

Stefanini

2025 — Present

Tech Lead

RCI (Renault Credit International)

- Lead a cross-functional team of 2 developers and 1 QA engineer, authoring functional specs and technical documents to reduce ambiguity and maintain delivery pace.
- Lead the design of a proprietary LLM + template-based OCR system for invoice text extraction, projected to reduce cloud infrastructure costs by up to 80%.
- Delivered the full migration of the invoice approval flow to the mobile app as the first production MVP, enabling end-to-end document approval on iOS and Android.
- Lead the ARCA/AFIP regulatory integration into the invoice approval flow across both the Hub Digital web and mobile platforms.

Technologies: Java, Spring Boot, Angular 17, Ionic, Capacitor, TypeScript, SQL Server, Activiti BPMN, Google Cloud Storage, RabbitMQ

Banco Macro

- Serve as development module lead for Sainapse at Banco Macro, acting as primary technical contact for client engineers adopting an AI-powered platform that uses LLMs for automated code analysis.
- Coordinate across a PM, QA lead, and 2 DevOps engineers to scope and ship product upgrades (including bug fixes and new features) aligned with Banco Macro's enterprise requirements.
- Designed and implemented a cloud abstraction layer across 5 microservices, enabling deployment on either AWS (DynamoDB, S3, Bedrock, Secrets Manager) or GCP (Cloud Storage, Firestore, Vertex AI, Secret Manager) without code changes.
- Built a provider-agnostic git integration layer across 2 microservices, enabling Sainapse's repository analysis to run on both GitHub and GitLab without code changes.

Technologies: Python, FastAPI, Microservices, AWS, GCP, Generative AI, Machine Learning

Ford

- Conduct technical interviews and assess mid-to-senior engineering candidates for Ford-related engineering positions.

Stefanini

2024 — 2025

SemiSenior Full Stack Developer

RCI (Renault Credit International)

- Owned end-to-end delivery of Hub Digital (~200 users), an internal document management platform for expense reports, insurance requests, and vendor invoices—including production deployments and ongoing technical support.
- Delivered a commission tracking module enabling the business to automate commission calculations for the first time, processing FTP-uploaded CSV files via a scheduled batch job.
- Led the incremental AngularJS-to-Angular 17 migration across 3 microfrontends with zero service interruption, eliminating a critical legacy dependency.

- Integrated Google Cloud Storage and Document AI to automate invoice data extraction, replacing fully manual data entry for the document management workflow.

Technologies: Java, Spring Boot, Angular 17, AngularJS, Ionic, Capacitor, TypeScript, SQL Server, Activiti BPMN, Google Cloud Storage

Interbanking

- Engineered 2 of 5 Quarkus microservices in the decomposition of Interbanking's Java 8 monolith, replacing legacy infrastructure for the VEP payment platform serving 40k+ companies paying AFIP tax obligations.
- Built a payment service with idempotency and distributed locking, eliminating race conditions under high concurrent load.

Technologies: Java 17, Quarkus, Microservices, Node.js, Nest.js, Oracle Database, MongoDB, Kafka

Upward Solutions

2022 — 2024

Backend Developer

- Engineered Node.js and Express.js microservices as sole backend developer on a 3-person team, for a white-label tax liquidation SaaS sold to accounting firms across Argentina, with ARCA regulatory integrations.
- Built REST API endpoints in Kotlin with Javalin for a second service in the platform, delivering features to ~700 weekly active users.
- Achieved 80% unit test coverage on the tax liquidation backend, enabling safer production deployments and faster refactoring.
- Built a Python and Selenium scraping bot that automated fiscal data extraction, eliminating periodic manual downloads and reducing team overhead.

Technologies: Node.js, Express.js, Kotlin, PostgreSQL, MySQL, Python, Selenium

EDUCATION

Universidad Abierta Interamericana (UAI)

2025 — In Progress

Systems Engineering

SKILLS

Java · Spring Boot · Quarkus · GCP · TypeScript · Node.js · Angular · Microservices · Kafka · PostgreSQL · MongoDB · Python
